## **ABSTRACT**

## ORTHODONTIC APPLIANCE WITH LATCH FOR RETAINING AN ARCHWIRE

5

10

An orthodontic appliance includes a latch that comprises at least one clip with a region for receiving an archwire. The clip also includes a recess for receiving a post of the appliance, and the recess is not in communication with the archwire-receiving region. The post functions to secure the clip to remaining components of the appliance, such as a body or base of the appliance. Optionally, the clip may include a second recess for receiving a second post of the appliance.
